Dowmetal

is riding high!

The New Douglas DC 5

SUPER-ACTIVITY in aviation is currently putting the spot-light on the unique value of magnesium—the

world's lightest structural metal.

In aeronautics, the race for greater speed—greater payload—hinges on the elimination of needless weight. Magnesium, weighing only one fourth as much as iron—one third less than any other metal commonly used—is rapidly being specified in an increasing number of applications.

But, aviation is not the only field in which magnesium is riding high. The whole realm of transportation—railroads, buses, trucks, passenger cars, and

even tractors—is fast adopting magnesium as the means of stepping up performance, pay load capacity and power utilization through weight reduction.

Industry, too, is taking an ever-growing advantage of the high-strength low-weight ratio of this metal. In machinery, household and office appliances, hand and portable tools, it is doing what no other metal can accomplish.

Magnesium, known in metallurgic circles as DOWMETAL*, is a basic metal like iron, tin, copper or aluminum. It is not only light—but strong and durable; ready to serve in many heavy-duty applications. For example, DOWMETAL landing wheels on the huge, multi-motored transport planes withstand the shock and impact of tons.

DOWMETAL, produced in a wide range of specialized alloys, is available in sheet, strip, plate, sand, die and permanent mold castings; also standard and special extruded shapes. It can be worked by all common methods such as stamping, forging, drawing, hot-forming, riveting, and welding.

No wonder that DOWMETAL is riding high in American industry. It speaks the idiom of present-day designing and fabrication—greater performance through *lightness*.
